Harness AI with a DAG

The graph abstraction behind neural nets, approval flows, and real program logic.

VL DAG AI Assistant

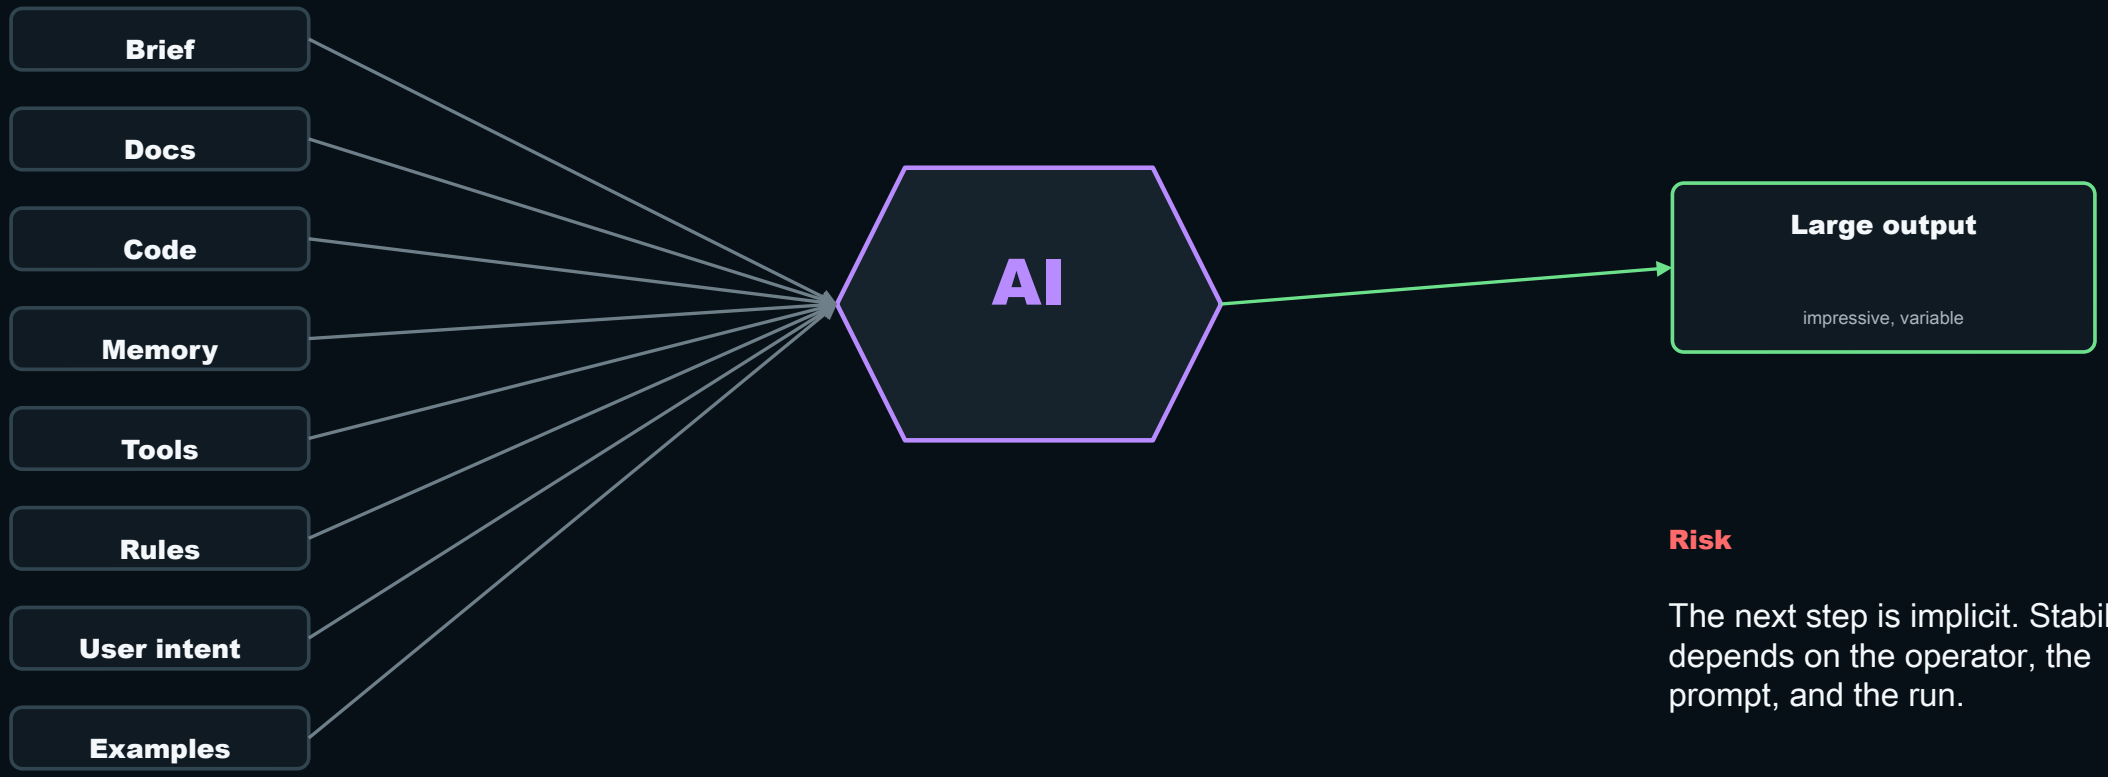

The pattern is already everywhere

VLC integrates proven graph ideas into AI-native software production.

One AI node is powerful, but unmanaged

A big output is not the same as a complete process.

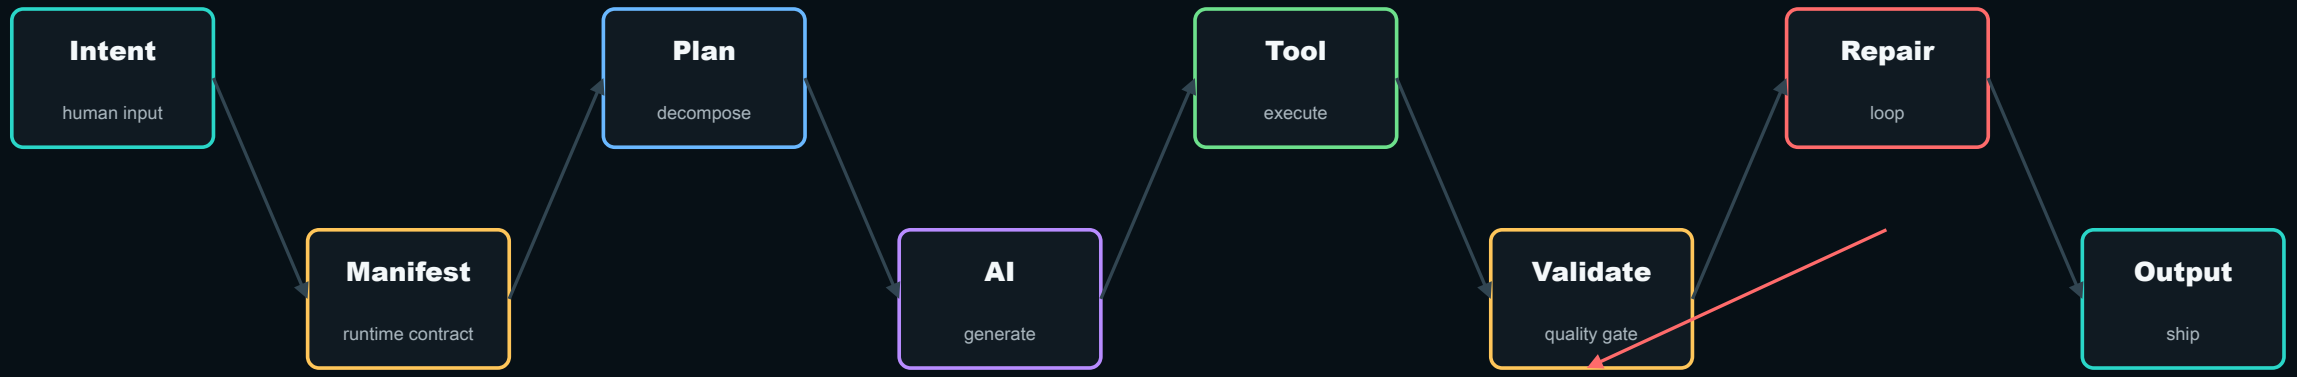

Risk

The next step is implicit. Stability depends on the operator, the prompt, and the run.

A DAG turns AI into a process

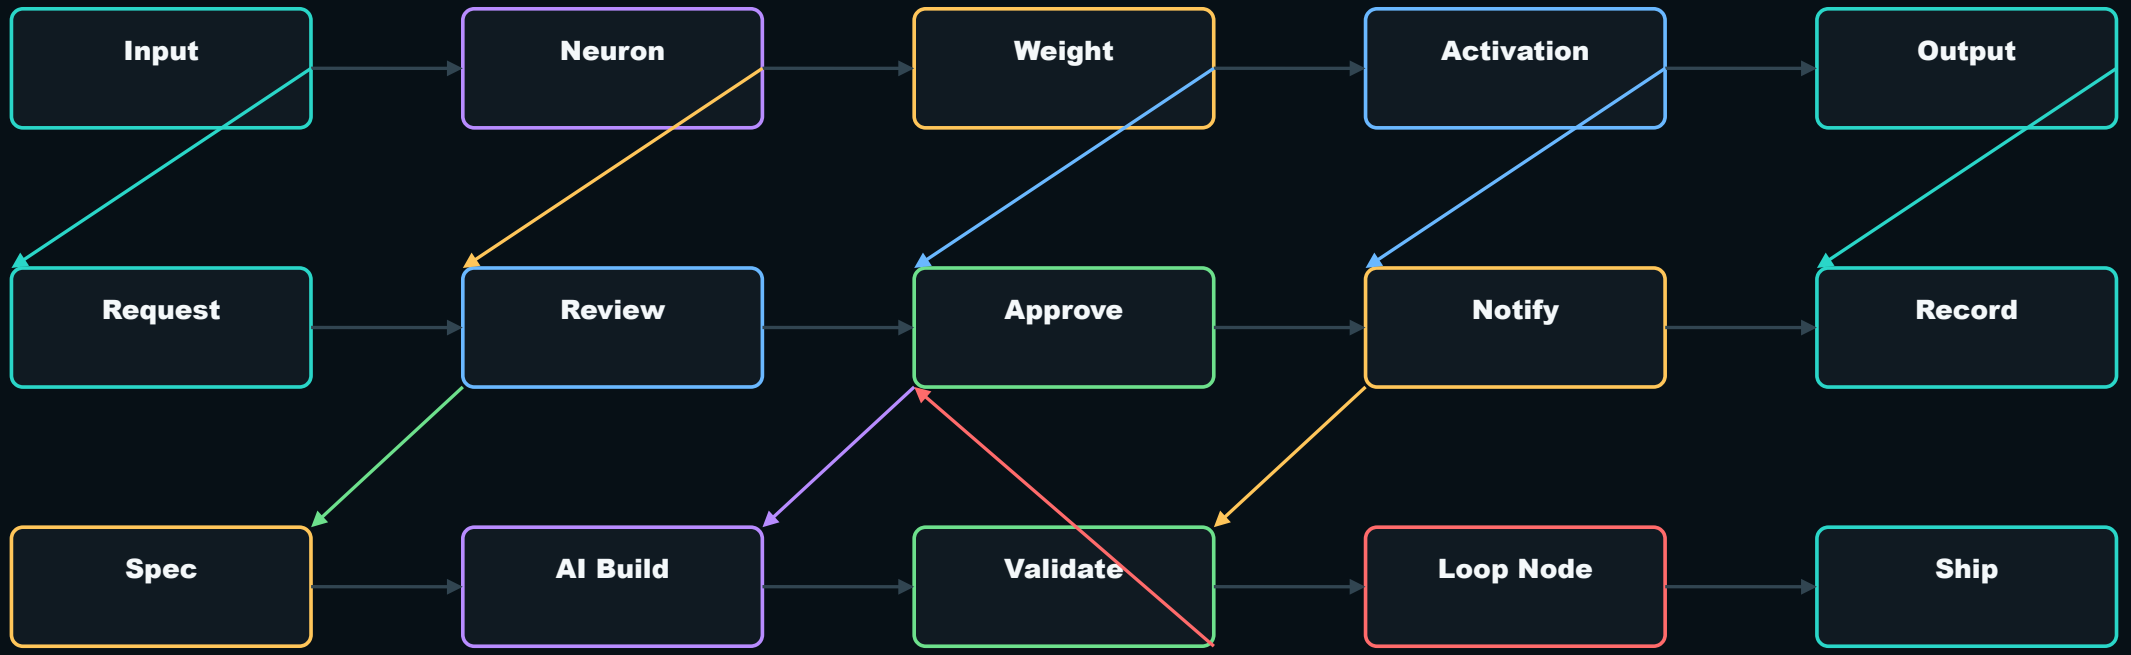

The same graph shape appears in neural nets, approvals, pipelines, and programs.

Neural-style nodes | typed dataflow | checkpoints | retries | human gates

Loops are allowed; execution stays traceable

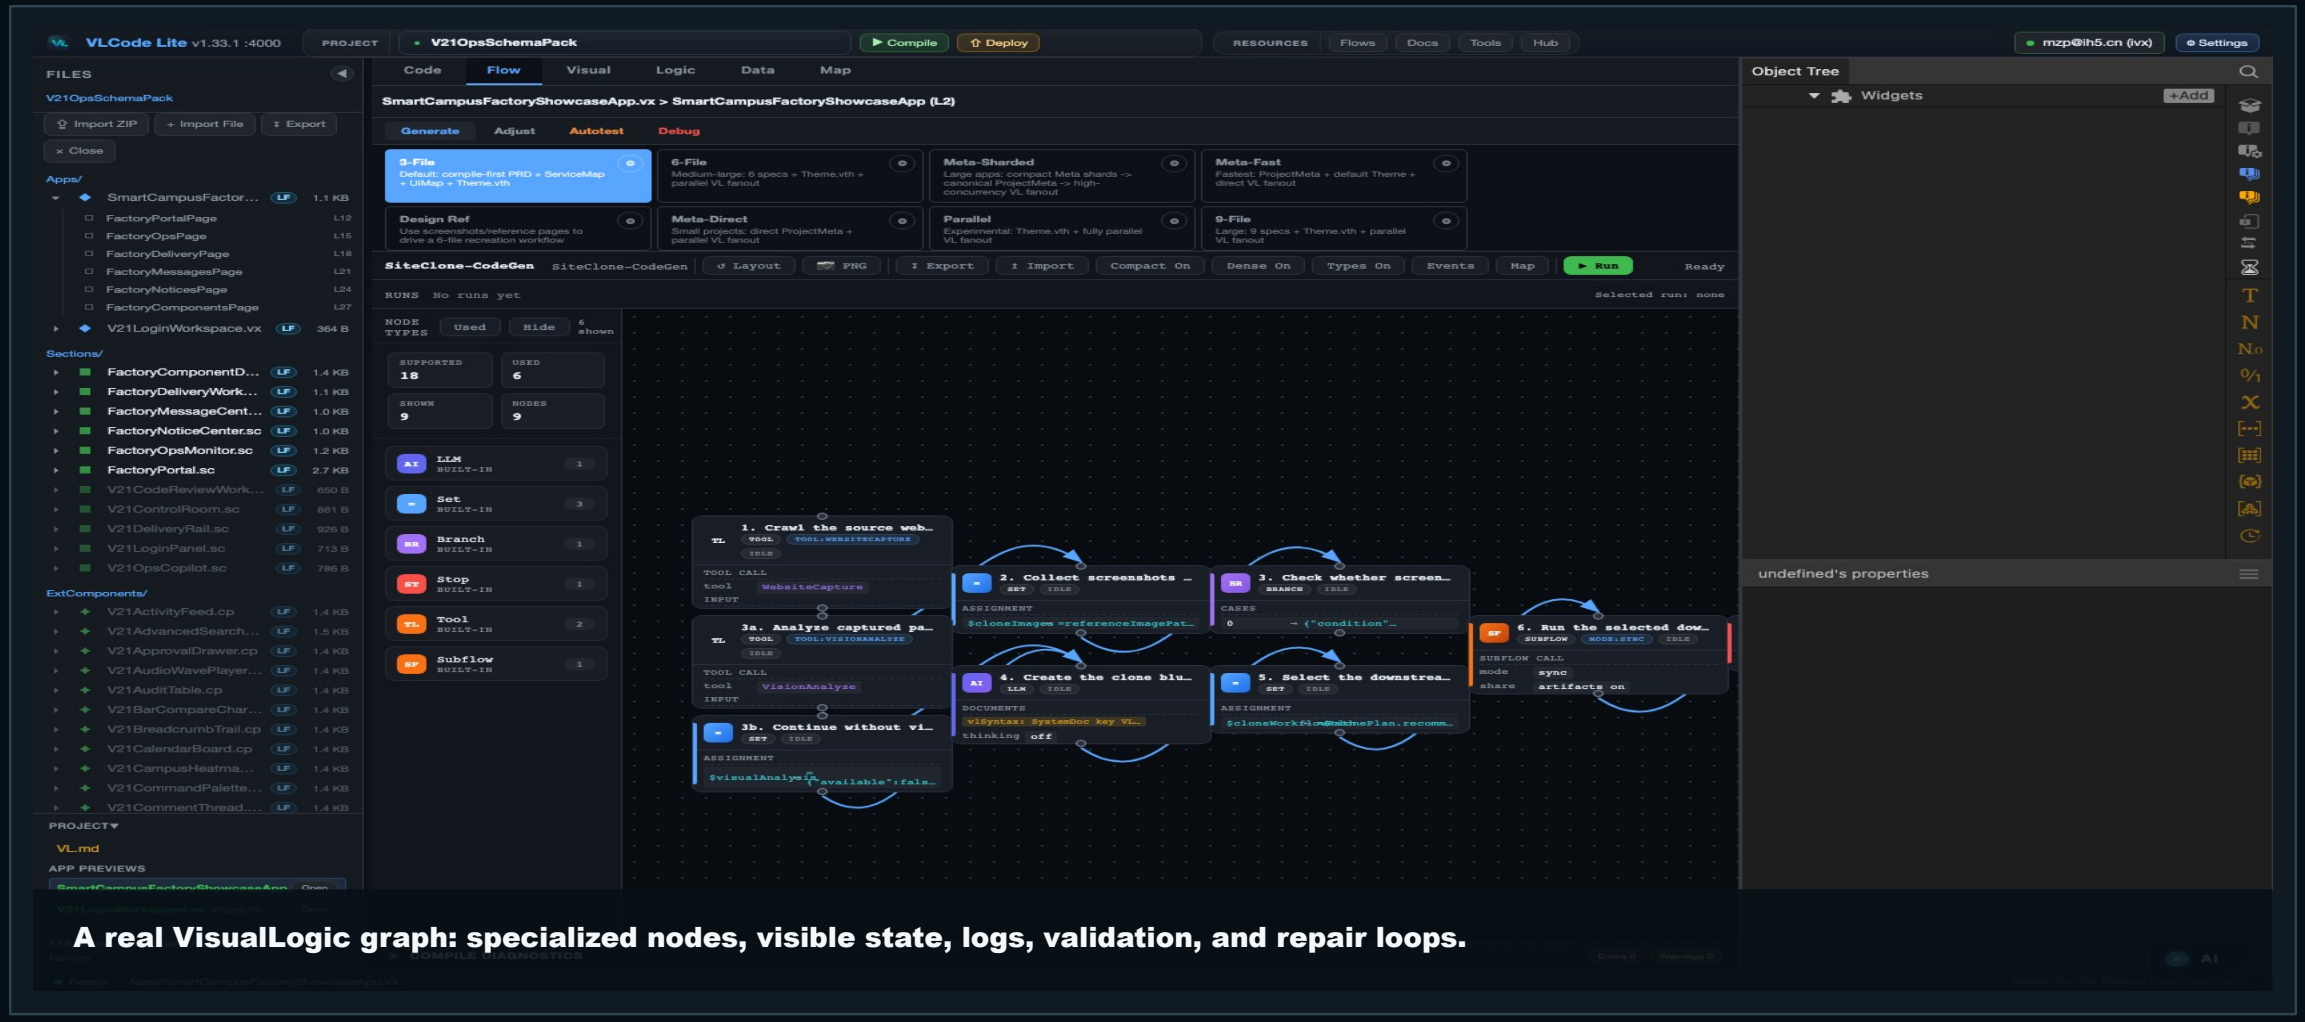

The design graph may cycle, while each run unfolds into an auditable acyclic trace.

Retry loops | Cycles | State machines | Loop nodes | Acyclic trace

Real VLC Flow mode

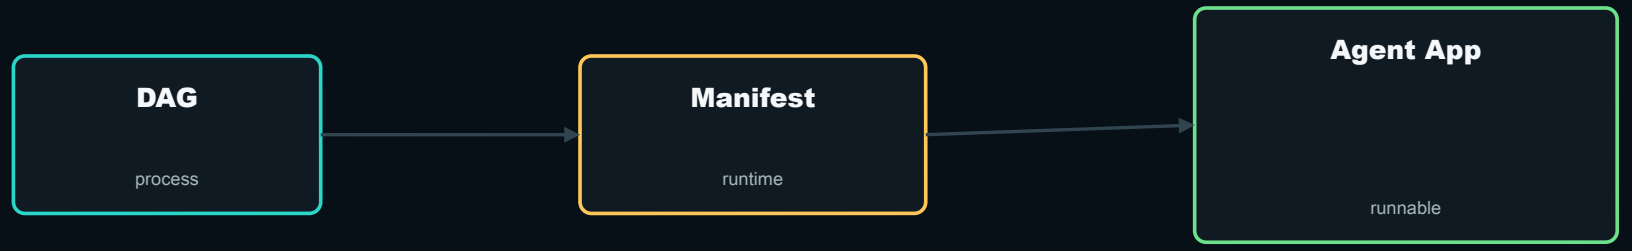

Complex DAG workflows are already visible and runnable inside VLC.

A real VisualLogic graph: specialized nodes, visible state, logs, validation, and repair loops.

Agent Apps are DAG plus manifest

A workflow becomes a runnable, shareable application.

Inputs / outputs
Typed entry points

UI panels
Interaction surface

Permissions
Runtime boundaries

Tools / skills
Callable capabilities

Human gates
Review and approval

Packaging
Local or remote run

VL makes the system composable

Structured layers plus components make parallel AI development practical.

Structured layers

Contracts, services, pages, sections, and themes are decoupled. Once the contract is clear, teams and agents can build in parallel.

Pure components

Everything can be composed: UI, flows, tools, skills, services, and theme resources. Components expose methods, properties, and events.

Simple for agents

The language is easy for people and AI to learn. Agents can call components directly instead of guessing hidden behavior.

More reusable components -> faster delivery -> more reliable enterprise adoption.

VisualLogic AI

VL + DAG + AI Assistant

Free local IDE

Download VL-Code and build real projects with visual flows, component resources, tools, skills, and AI assistance.

Open resources

Design and upload flows, components, tools, and skills. Platform resources from VisualLogic are free to use.

Enterprise landing

Designed for complete project generation, not isolated code fragments. Project managers and non-developers can participate directly.
